# Abdul Moiz Sheikh

Lahore, Pakistan · +92 314 7627917 · abdulmoizsheikhh@gmail.com · github.com/MoizSheikh

**Full-Stack Software Engineer — React / TypeScript · Python.** 6+ years shipping consumer-scale products. At Laam I own the Ads lane end-to-end — product decisions, the promo and subscription monetization model, and Ads V2's personalized recommendations. Previously tech lead of a 6-engineer team on Dubizzle Group's central CRM across 15+ country configurations, after nearly 2 years working remotely with a US team.

## EXPERIENCE

**Laam — Software Engineer III** Apr 2025 – Present · Lahore · fashion marketplace, ~half of sales international

- **Lane owner for Laam Ads, working like a forward-deployed engineer** — own product decisions directly with sellers and advertisers, write the design docs, and make the architecture calls; **led Ads V2**, building a **personalized recommendation engine** and **actionable per-product insights** that tell sellers what to promote and how.
- Grew the ads business to **220+ billed advertisers a month** and a **record ~$270K revenue month (Mar 2026)**.
- **Designed and introduced Laam Ads' promo and subscription monetization model** — promo ledger with bonus impressions and impression multipliers, subscription commitments, consumed-amount tracking, pool expiry, revocation, first-time-seller free promos, schedulers, and pub/sub events.
- **Bootstrapped ads.laam.com end-to-end** — a new self-serve platform opening Laam to external advertisers — auth, role guards, service infrastructure (IAC), admin UI, and dashboards.
- Ads serve **1M+ impressions a day (peak 1.88M)** on a split pipeline — Redis decides what serves, **ClickHouse decides what's billed**: hourly materialized views re-fold each campaign's own fatigue cooldown, split paid vs. promotional impressions, and settle impressions × rate (minus promo/commitment credit) into the vendor ledger.
- **Introduced impression-fatigue capping**, configurable per ad, to stop over-serving the same users and keep delivery numbers accurate.
- Built the **full billboard campaign lifecycle** — prepaid/postpaid billing, auto-invoicing, payment-proof verification queue, and a payment ledger with scheduled jobs.
- **Rebuilt Reviews & Ratings** from a single denormalized table into a full system — reviews/interactions/log schema, brand and product ratings (migrations, live backfill, Elasticsearch indexing); **total reviews up 57% (+185K)** and **reviewed products up 48%** since Jan 2026; store review coverage **19% → 28% in one month**.
- **Designed and built rating trust for the whole catalogue** — replaced plain averages with a **Bayesian score measured against each category's baseline, with older reviews weighted down**, so a 5.0 from two buyers no longer outranks a 4.7 from four hundred; a weekly drift-based recompute keeps **~89K products** fresh, and search ranking runs on the adjusted score.
- **Built Laam's single design system**, now followed by every Laam app, and led the partners-app migration onto it; closed **~50 on-call tickets in 3 months**, including a solo on-call week.

**Dubizzlelabs (Bayut & OLX) — Software Engineer II** Jun 2022 – Apr 2025 · Lahore

- **Tech lead for a 6-engineer sub-team** on Jarvis, Dubizzle Group's central CRM — ran sprints, code reviews, and architecture calls, reporting into the platform lead.
- Led Jarvis's migration from the legacy Webpack toolchain to **Vite + React 18** — lazy loading, Suspense, and React Query caching.
- Built backend features on Jarvis's Python/FastAPI services, including **single-schema multi-tenancy** — tenant scoping as a dependency with SQLAlchemy-level tenant injection.
- Owned the frontend across the CRM and its sub-apps, supporting **15+ country-specific configurations** — drove the move from per-tenant conditionals to config-driven rendering behind a feature-flag hook.
- Designed the CRM's **i18n contract**: backend emits machine codes + params, frontend translates through a key-based t() layer — adding a language touches zero backend code; migrated translatable content to a per-language JSONB column.
- Built the frontend for **Arabic-language search** in MENA markets — RTL layout, Arabic input and results handling; delivered tenant onboarding for the **KSA market launch**.

**Lyftrondata — Software Engineer I** Aug 2020 – Jun 2022 · Virginia, USA (remote)

- Built the configuration UI of a data-integration platform through which **50+ ETL connectors** are set up, cutting pipeline creation to **under 5 minutes**, and helped build the connector pipelines on its **Python/FastAPI** backend.
- Built the data-catalog module (UI plus dynamic row/column permission logic) and added IndexedDB caching to the platform's data-fetch layer.
- Refactored legacy frontend code to cut duplication; onboarded and **mentored 4 new engineers**.

## PROJECTS

**MyCLM (Mycelium) — Solo founder-engineer** Live · Next.js · Supabase · n8n

- **Architected MyCLM, a no-code platform** for contract lifecycle and freight-forwarding operations — ops teams build their own tables, pages, workflows, invoices, and PDFs through a visual builder, and **every client runs on its own isolated database and automation server**.
- **Built a compiler that turns drag-and-drop React Flow workflows into live n8n pipelines**, guarded by 20 correctness checks; it powers an AI pipeline that reads air-freight pre-alert emails, uses **GPT vision to extract data from scanned PDFs**, and creates the full shipment record with all 12 milestones — no manual typing.
- **Shipped a complete finance layer** — cost and revenue ledgers, one-click invoices with branded PDF templates, **multi-currency FX locked at publish**, and automatic fiscal-year reference numbering; forwarders go from shipment to client invoice without leaving the app.
- **Built AI copilots that design data models and pages from plain English**, scoring **96% on a custom eval suite**; cut a key operations page from **82 components to 14** and batched its database calls into one.

**Align (alignwithme.com) — Solo engineer** Live · Next.js · OpenAI · SaaS for teams

- **Built Align end-to-end solo** — a SaaS that turns each teammate's MBTI, DISC, Enneagram, Kolbe, and CliftonStrengths results into one **AI-generated Personal User Guide** colleagues use to work with them.
- **AI voice interview** — a 10-minute guided conversation that captures work style beyond the tests and feeds the guide; **team dynamics clustering** and an **AI chat over the whole team** for meeting prep and communication advice.
- **Culture Database** — **441 company culture profiles synthesized from 5,389 cited sources** (Glassdoor, Reddit, Blind, press); new companies researched live in under 60 seconds.
- Free / per-seat Team / Enterprise plans with team workspaces, admin controls, and SSO.

## SKILLS

**Core:** React · Next.js (App Router, server actions) · TypeScript · JavaScript · Design systems · SSR / e-commerce frontend · Python + FastAPI · Node.js

**Also:** Redux · React Query · Tailwind · Radix/shadcn · zod · react-hook-form · REST · WebSockets · SQLAlchemy · i18next · frontend performance (Core Web Vitals, Lighthouse, code splitting)

**Data:** PostgreSQL · MySQL · MongoDB · Redis · ClickHouse · Elasticsearch

**Infra:** Docker · CI/CD (GitHub Actions) · Terraform · AWS (S3, EC2, ECS, RDS, Lambda) · GCP · Sentry

## EDUCATION

**BS Information Technology** — PUCIT, Lahore · CGPA 3.32
